ABSTRACT

This paper aims to study the inter firm differences in the Indian manufacturing industries, in context of the firms’ decision to participate in CDM. We start off with a brief introduction to the history of the setting up of the schemes of carbon markets in the world and proceed to give a brief overview of its present status. Then we state the motivations and objectives of our study. Then we move onto analyze the structure of the carbon emission in India and how is it related to the present growth scenario of our country. After that, we describe the data and methodology we shall be using in our study and describe the models of estimation to be used. Moving on from that, we shall vividly describe our findings and inferences from the study and then draw our conclusions from the study and suggest relevant policy prescriptions.
