

ABSTRACT:

This paper tries to analyse the direct and indirect effects of climate change on human health. It gives us an idea about how we can predict the future and give reason about the ongoing situation considering the pandemic in view and visualising the goals and aims the government focuses to keep the environment safe that automatically is a blessing for humankind. This paper gives an overview of the 4 different indirect and direct reasons we will be looking up for such as in case of Indirect impact – malaria and respiratory infections, and for direct impact – Heat Waves and Air pollution. This paper discusses about the pre and post covid scenarios too to have a better understanding by taking data from different Government sites like National Vector Borne Disease Control Programme (NVDCP), IMD (Indian Metrological Department) and National Health Portal of India etc. At nutshell in upcoming decade, we would see a decline in no. of death rates in both malaria and respiratory diseases but in case of heat wave it may likely to fluctuate depending upon the external factors.
