

## ABSTRACT

This abstract presents an analysis of the impact of COVID-19 vaccines on measures of activity in India, focusing on economic recovery. The rollout of COVID-19 vaccines in India has played a crucial role in stimulating economic activity in the country. Vaccination efforts have provided a sense of confidence among businesses, resulting in the gradual reopening of industries and the resumption of commercial operations. As vaccination coverage has increased, sectors such as manufacturing, hospitality, and retail have witnessed a revival, leading to improved productivity, job creation, and consumer spending. The availability of vaccines has instilled optimism among investors and stakeholders, contributing to the overall recovery of the Indian economy. Despite the positive impact of COVID-19 vaccines, several challenges persist in India. Vaccine distribution and accessibility across different regions and population groups need further attention to ensure equitable coverage. Vaccine hesitancy and misinformation pose barriers to achieving optimal vaccination rates. Continued efforts in vaccine education and addressing concerns are necessary to enhance vaccine acceptance and uptake.
